

Data Collection and Preprocessing Phase

Date	June 2024
Team ID	740103
Project Title	The Language Of You tube: A Text Classification Approach To Video Descriptions
Maximum Marks	6 Marks

Preparation Template:

The images will be pre processed by resizing, normalizing, augmenting, denoising, adjusting contrast, detecting edges, converting color space, cropping, batch normalizing, and whitening data. These steps will enhance data quality, promote model generalization, and improve convergence during neural network training, ensuring robust and efficient performance across various computer vision tasks.

Description

Section	
Data Overview	There are many popular open sources for collecting the data. Eg: kaggle.com, UCI repository, etc. In this project we have used .csv data.
Data Preparation	These are the general steps of pre-processing the data before using it for machine learning
Handling missing values	We use Handling missing values For checking the null values
Handling categorical data	As we can see our dataset has categorical data we must convert the categorical data to integer encoding or binary encoding
Handling Outliers in Data	With the help of boxplot, outliers are visualized. And here we are going to find upper bound and lower bound of numerical features with some mathematical formula.
	Preparation

Collect the dataset	Please refer to the link given below to download the dataset.
Conect the dataset	Youtube Videos Dataset (~3400 videos) (kaggle.com)

```
import pandas as pd
                                      import matplotlib.pyplot as plt
                                      import seaborn as sns
                                      import re
                                      import time
                                      import warnings
                                      warnings.filterwarnings('ignore')
                                      import numpy as np
                                       from nltk.corpus import stopwords
                                       from sklearn.feature extraction.text import TfidfVectorizer
                                       from sklearn.feature extraction.text import CountVectorizer
                                       from sklearn.model_selection import train_test_split
                                       from sklearn.model_selection import GridSearchCV
Importing the libraries
                                       from sklearn.linear_model import SGDClassifier
                                       from sklearn.metrics import f1_score
                                      from sklearn.metrics import accuracy_score
                                      from sklearn.metrics import confusion matrix
                                      from sklearn.metrics import precision score
                                      from sklearn.metrics import f1 score
                                      from sklearn.metrics import recall score
                                      from sklearn.preprocessing import LabelEncoder
                                       from sklearn.ensemble import RandomForestClassifier
                                       from nltk.stem import PorterStemmer
                                       import nltk
                                We use the code
                                Data =pd.read csv('YoutubeDataSet.csv')
Loading Data
                                For reading the dataset
```

```
M Category=data['Category'].value_counts()
                                       print(Category.shape)
                                       print(Category)
Handling missing values
                                       travel blog
                                                             2200
